# Quick List

USER MANUAL

The quick list python application is a great tool to quickly make a shopping list, grocery list or maybe a list for the things to buy a birthday party. Items can be added to the list and each item can be checked off from the list if bought or not required anymore. The list can also be saved to view later and also exported as a CSV file.

The purpose of this application is to provide a simple way to make a shopping list quickly without the complications present in many of the shopping list apps available in the market.
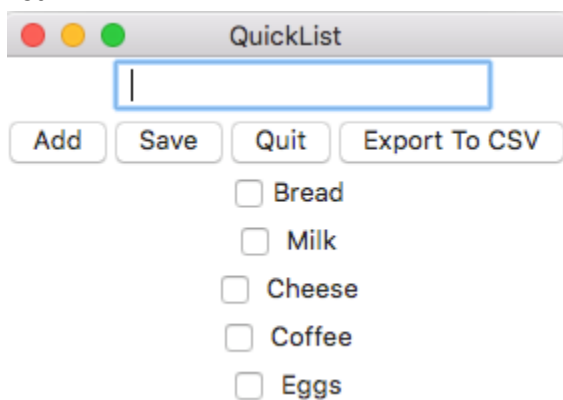

The application has an easy and intuitive interface.

- The main window lets the user enter an item name on the text box and by clicking "Add" or hitting the Enter key on the keyboard, that item can be added to the list. To exit the application, the user can simply press the "Quit" button.
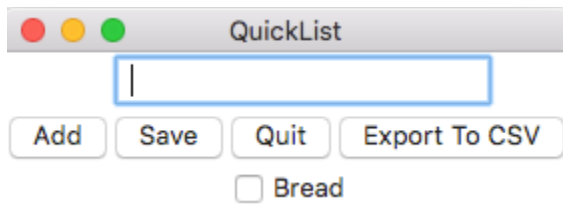

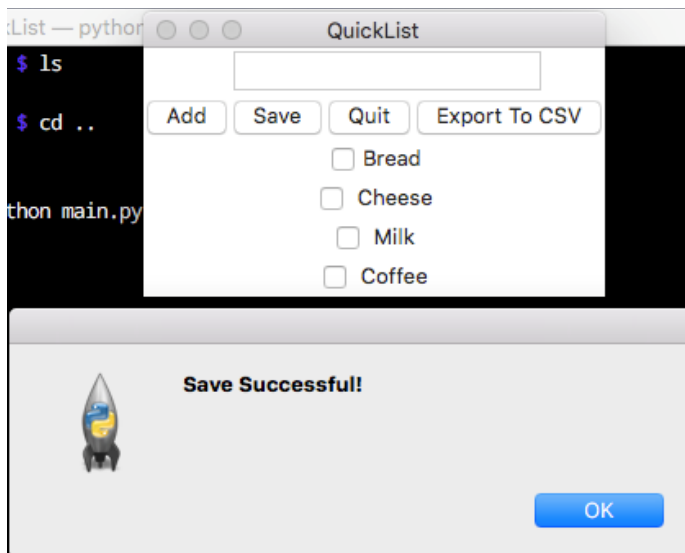

-

- The list is visible in the window and expands downwards as more items are added to the list.

- Every item that is added to the list has a checkbox next to it, this checkbox can be used to check off an item and remove it from the list.

- The list also be saved using the "Save" button and when the application is reopened the saved list is restored as it was before.

- The button "Export to CSV" can be used to export the list to a CSV file. But the list needs to be saved first before exporting.
